Connecting to new CELL Machines

First, please note, the campus VPN Client MUST be used to connect if you are off campus.

The previous information that I had included with which you will login only considered my personal terminal application (MobaXTerm). I used it as an example, but mentioned that other applications will be have slightly differently in the way that you authenticate. Syntax will vary from application to application. A few of the ones that have been mentioned by faculty are listed below.

- If using a more modern terminal program like MobaXTerm on Windows, connection will be as I had previously detailed.
  - Students: `ssh euid@cell01-cse.eng.unt.edu`
  - Faculty: `ssh unt\euid@cell01-cse.eng.unt.edu`

- If you are still using putty to connect, this will be different. You will specify the host name as `cell01-cse.eng.unt.edu`, and then once connected you will enter `unt\euid` (replacing euid with your euid)

- If you are using Windows Command Prompt, you should just need to enter a single slash as well.
Connecting to new CELL Machines

- WinSCP for FACULTY will need to enter their user name as ‘unt\euid’ (single slash)
Connecting to new CELL Machines

- WinSCP for students will just require their euid and password:

- For students, whether WinSCP, Putty, MobaXTerm, terminal, Windows CMD, etc. They should only need to specify their euid and password. (STUDENTS\euid is not needed)
